

Tutorial 3

Ex1:Recap, ER-Models,
Extra: Uniform templates

Exercises

- You don't have to submit the assignment (it's perfectly fine if you just solve it for yourself)
- We do not grade the assignments
 - We just look at the submitted tasks to see if there are any problems, general errors, etc.
- In general, the tasks are just for trial and error :)
- But you can always ask us (or look at the solutions first) if you have any difficulties

Exercise 1

- Well done! They look very good :)
- However, we noticed that only 6 of you submitted your exercises, which is perfectly fine. But it seems not everyone has even looked at the exercise yet.
- Even if you don't plan to submit it, we encourage you to at least give it a try. You learn best by doing things.

Exercise 1

- Linking E-Mail address
 - `Some text`
 -
- Link to anything
 - `Some text`
 -
- Favicon implementation
 - `<link rel="icon" href="path/to/favicon.ico" type="image/x-icon">`
 - (favicon does not need to be huge in size, this will only increase the loading time)
 -
- Add whitespace after elements
 - `3 g salt` vs `3 g salt`

• **3 g***salt*

• **3 g** *salt*

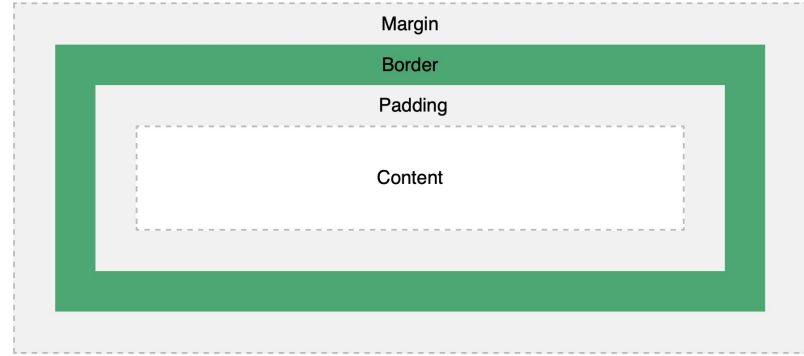

Exercise 1

- You can assign multiple classes → grouping
 - `<h3 class="pumpkin subtopics">Pumpkin Pie</h3>`
 - `<h3 class="topping subtopics">Topping</h3>`
 - ⇒ can add layout to both by using `.subtopics` and then assign color individually by using `.pumpkin` or `.topping`
- Make sure all tags have a corresponding closing tag
 - Even though the browser tries it's best to render the HTML anyway

Padding and Margin

- Content - The content of the box, where text and images appear
- **Padding** - Clears an area around the content. The padding is transparent. It's the **space between an element's border and the element's content**.
- Border - A border that goes around the padding and content
- **Margin** - Clears an area outside the border. The margin is transparent. It's the **space around an element's border**.

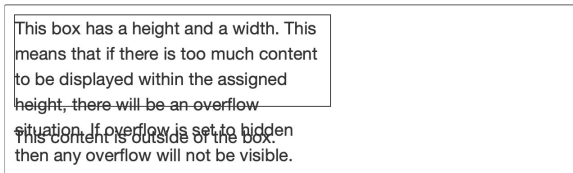

[CSS Box Model](#)

CSS

- Overflowing content

- CSS tries to avoid data loss
- Can happen if too much text for a height restricted box or box too small for font

- ⇒ overflow property
 - overflow-y: scroll; → add scrollbar on y-axis
 - overflow-x: scroll; → add scrollbar on x-axis
- You can try it out [here](#)

CSS

- Remember, the CSS rules are read from the top down, one at a time. This means that rules that are at the bottom override rules defined on the top
 - → Order the rules from most general to most specific
- If possible, use the same rules for multiple classes

```
header, main, footer {  
    padding: 2em;  
}
```

Reminder: Entity Relationship Model

1. What kind of Entity Relationships can we have?

Example:

- We have a Database at a vet which keeps track of its patients, their owners and their medical problems.
- A pet only has one owner but a owner can have multiple pets.
- One pet can have multiple illnesses and many pets can have the same illness.
- Each entity has some additional attributes describing it in more detail.

Reminder: Entity Relationship Model

1. What kind of Entity Relationships can we have?

Example:

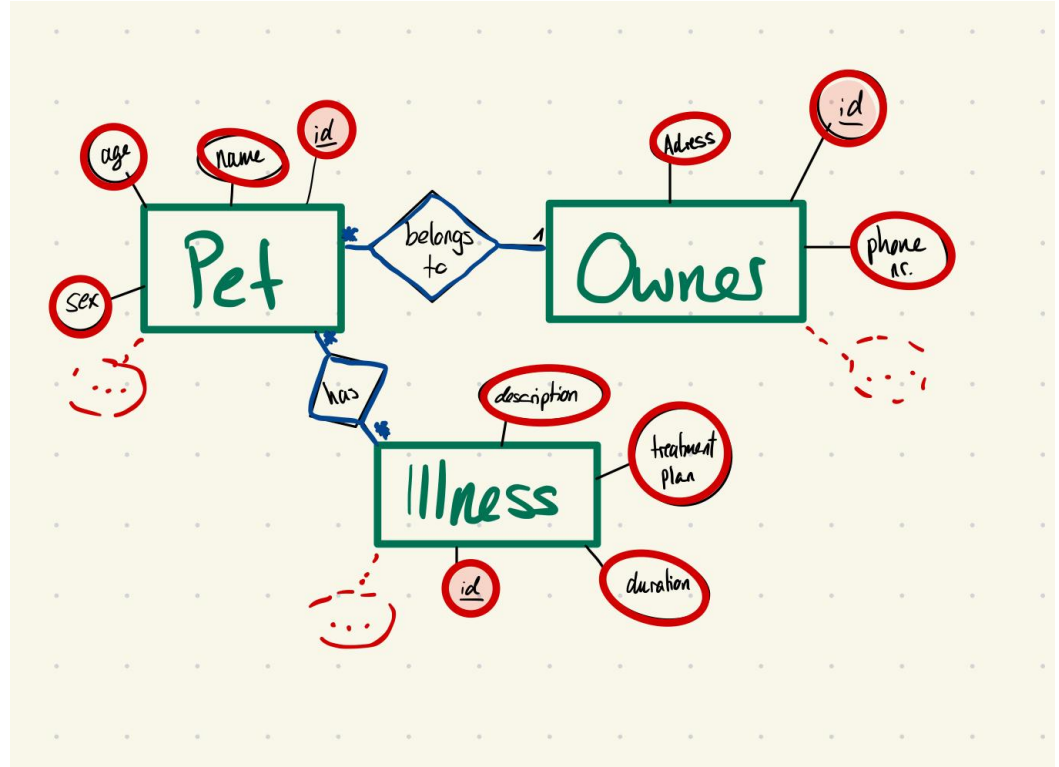

- We have a Database at a vet which keeps track of its **patients**, their **owners** and their **medical problems**.
- A pet only has one owner but a owner can have multiple pets. (1 owner to many pets)
- One pet can have multiple illnesses and many pets can have the same illness. (Many to many relationship)
- Each entity has **some additional attributes** describing it in more detail.

→ See next slide for possible ERD

Possible Solution

Making use of Foreign keys

And relationship tables to reduce repetitions.

Extra: Uniform Templates for your Flask App

Get to know flask templates better: [Templates — Flask Documentation \(2.3.x\)](#)

- Parent template → extends children
- Define content blocks
 - everything outside of those blocks in the parent html will be extended to every child html
 - Everything inside the blocks can be edited and personalized for each child html

(Demo) simple flask example app using a base template for uniform look over multiple pages.

Exercise 2

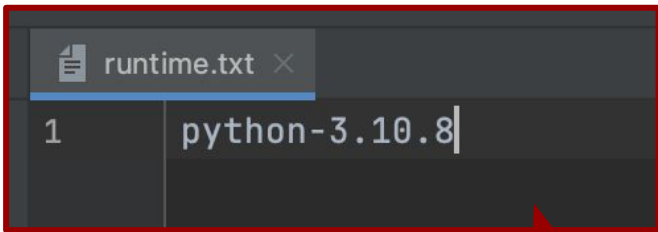

- Out now, you can submit it until Wednesday, October 11, 12:00.
- Design an html page according to an image
- It does not have to be an exact copy, just more or less :)

Please give it a try :)

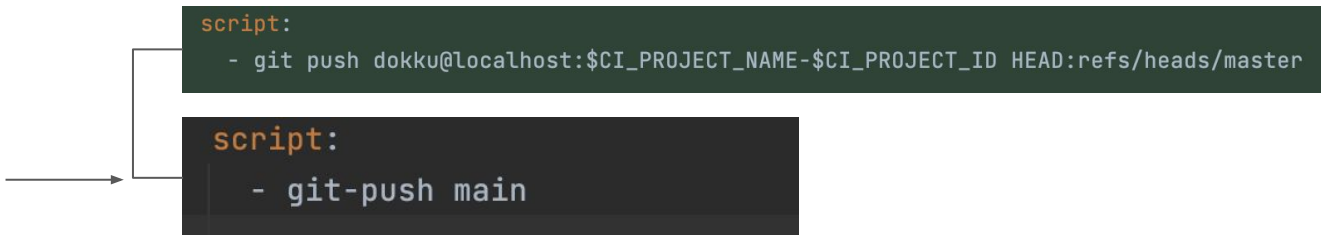

Appendix

Possible Deployment Fails

- **Check** the failed “Job” report
- **Check** if VPN is connected
- **Check** if new import statements were added to the “requirements.txt” file
 - Enter “Pip freeze” to get a list of all imported modules and their versions currently in you virtualenv.
 - For example add your “pyscopg[binary] / psycopg2” version
- Sometimes it can happen that during deployment a cached non-compatible python version is used during (e.g. version 3.11 can cause failing)
 - To fix that, add a “runtime.txt” file on the same level as your requirements file and define the desired python version (anything between 3.8-3.10) should work ok.
- After adding the DB env. Variables forgot to update the .yml file for “script”:

A screenshot of a text editor window titled 'runtime.txt'. The first line of the file contains the text 'python-3.10.8'. A red arrow points from the bottom right of the editor window towards the main list of deployment fails.

A diagram showing two code blocks. The top block contains the following text:

```
script:  
- git push dokku@localhost:$CI_PROJECT_NAME-$CI_PROJECT_ID HEAD:refs/heads/master
```

The bottom block contains the following text:

```
script:  
- git-push main
```

A white line connects the two blocks, starting from the right side of the top block and ending with an arrow pointing to the left side of the bottom block, indicating a replacement or update of the script section.
