GLSurfaceView View to draw and manipulate objects using OpenGL.

GLSurfaceView.Renderer Interface defining methods to draw (render) graphics.

- Add renderer to GLSurfaceView using GLSurface View.set Renderer ().
- Extend GLSurfaceView to capture touch screen events.
- Extend Android manifest when using OpenGL ES 2.0:

```
<!-- Tell the system this app requires OpenGL
ES 2.0. --> <uses-feature android:glEsVersion="0x00020000
   " android:required="true" />
```

Matthias Keil Android and OpenGL 1. Februar 2016 4 / 24

OpenGL Introduction

```
class MyGLSurfaceView extends GLSurfaceView {
  public MyGLSurfaceView(Context context){
        super(context);
        setRenderer(new MyRenderer());
// Called when using OpenGL ES 2.0
setEGLContextClientVersion(2);
```

1. Februar 2016 5 / 24

■ Includes three methods to be implemented to draw graphics.

onSurfaceCreated() Called once when creating the GLSurfaceView.

Should include all actions to do only once.

onDrawFrame() Called on each redraw of GLSurfaceView.

Do all drawing and redrawing of graphic objects here.

onSurfaceChanged() Called when the geometry of

GLSurfaceView changes, for example size screen or orientation.

Add code to respond to those changes.

Matthias Keil	Android and OpenGL	1. Februar 2016	6 /

OpenGL Introduction

- \blacksquare Two different OpenGL ES API versions available: 1.0(together with version $1.1\ \mbox{extensions})$ and 2.0.
- Both usable to create high performance graphics for 3D games and visualizations.
- $\hfill \blacksquare$ Grapic programming for one of the versions differs significantly to programming for the other version.
- lacktriangle Version 1.0/1.1 is easier to use as there are more convenience methods available.
- $lue{}$ Version 2.0 provides higher degree of control, enabling creating of effects that are hard to realize in version 1.0/1.1.

Displaying Graphics

- Shapes are graphic objects to be drawn in OpenGL.
- Shapes are defined using three-dimensional coordinates.
- Coordinates get written into ByteBuffer that is passed into the graphics pipeline for processing.
- $\quad \blacksquare \ \, \mathsf{Coordinate} \,\, \mathsf{format:} \,\, [\mathsf{X},\,\mathsf{Y},\,\mathsf{Z}]$
- Examples: Center of view: [0,0,0], top right corner: [1,1,0], bottom left corner: [-1,-1,0].

Notizen

Vertex Shader Contains code for rendering the vertices of a shape.

Fragment Shader Contains code for rendering the face (visible front) of shape with colors or textures.

Program OpenGL ES object containing shaders used.

- \blacksquare At least one vertex shader and one fragment shader needed to draw a shape.
- Both shaders must be compiled and then added to the program.

Displaying Graphics Mapping Coordinates for Drawn Objects University of Freiburg

- Problem: Device screen is no square, but OpenGL assumes
- The picture shows what happens. Left: How it should look. Right: How it looks in horizontal orientation.
- Solution: Use *projection modes* and *camera views* to transform coordinates.

Matthias Keil

Android and OpenGL 1. Februar 2016 11 / 24

Displaying Graphics Mapping Coordinates for Drawn Objects

- Create projection matrix and camera view matrix.
- Apply both to the OpenGL rendering pipeline.
- Projection matrix recalculates coordinates of the graphic objects to adjust the screen size.
- Camera view matrix creates transformation that shows object from specific eye position.

-

```
Displaying Graphics
Example in OpenGL ES 1.0: Projection Matrix
```

REIBUR

Notizen

- Create and use projection matrix in onSurfaceChanged() of the GLSurfaceView.Renderer implementation.
- Use geometry of device seen to recalculate coordinates.

```
ipublic void onSurfaceChanged(GL10 gl, int width
    , int height) {
    gl.glViewport(0, 0, width, height);
    float ratio = (float) width / height;
4    // set matrix to projection mode
    gl.glMatrixMode(GL10.GL_PROJECTION);
6    // reset the matrix to its default state
7    gl.glLoadIdentity();
8    // Define and apply the projection matrix
9    gl.glFrustumf(-ratio, ratio, -1, 1, 3, 7);
10}
```

Matthias Keil Android and OpenGL 1. Februar 2016 15 / 24

Notizen

 $\hfill\blacksquare$ Define a transformation in terms of an eye point, a center of view, and an up vector.

```
igluLookAt(GL10 gl, float eyeX, float eyeY,
    float eyeZ, float centerX, float centerY,
    float centerZ, float upX, float upY, float
           upZ)
```

1. Februar 2016 16 / 24

Displaying Graphics Example in OpenGL ES 2.0: Steps overvi

- 1 Define a Projection[5].
- Define a Camera View.
- 3 Apply Projection and Camera Transformations on all objects
- Step 1 and 2 very similar to OpenGL ES 1.0.

1. Februar 2016 17 / 24

Notizen

Displaying Graphics Example in OpenGL ES 2.0: Step 3 University of Freiburg

- Apply Projection and Camera Transformations on all objects to draw.
- Edit *draw* method of a shape:

```
1 public void draw(float[] mvpMatrix) {...
        unit void draw(float[] mvpmatrix) { . . . // get shape's transformation matrix matrix = GLES20.glGetUniformLocation(mProgram , "uMVPMatrix"); // Apply projection and view transformation GLES20.glUniformMatrix4fv(matrix, 1, false, mvpMatrix, 0); // Draw the charc
       myphacta, 0,
// Draw the shape
GLES20.glDrawArrays(GLES20.GL_TRIANGLES, 0,
vertexCount);
8
9 }
```

- \blacksquare Rotation can be simply added using OpenGL ES 2.0
- Create rotation matrix and combine it with projection and camera view transformation matrices.
- Extend onDrawFrame method.

1. Februar 2016 19 / 24

Displaying Graphics Adding Motion Example

```
float[] mRotationMatrix = new float[16];
// Create a rotation transformation for the
triangle long time = SystemClock.uptimeMillis() % 4000
L;
float angle = 0.090f * ((int) time);
Matrix.setRotateM(mRotationMatrix, 0, mAngle,
0, 0, -1.0f);

// Combine the rotation matrix with the projection and camera view
Matrix.multiplyMM(mMVPMatrix, 0,
mRotationMatrix, 0, mMVPMatrix, 0);
// Draw shape
mTriangle.draw(mMVPMatrix);
```

Touch Screen Interaction

Notizen

- Can be implemented by overriding the method onTouchEvent(MotionEvent) of the class View.
- *MotionEvent* gives you various information about where the event happened and how.
- Example: long MotionEvent.getDownTime() returns the time in ms when user started to press down.
- Also possible to recover *historical*/old coordinates of the event[3].
- Easy simulation in the emulator possible: Click, hold and move the mouse.

- Class Random can produce a random number_[6].
- Class Sensor is used to access sensors of the cellphone, e.g. the gyroscope[8].
- Class *MediaPlayer* enables playing of sounds_[2].
- \blacksquare Usage: Put a sound file into folder res/raw/.
- Supported file formats include ogg vorbis, wav, mp3 and

1 MediaPlayer mediaPlayer = MediaPlayer.create(context, R.raw.soundfile);
2mediaPlayer.start();

Android and OpenGL

1. Februar 2016 22 / 24

Summary

- Drawing with OpenGL takes place on *GLSurfaceView*.
- *GLSurfaceView.Renderer* is responsile to draw the shapes.
- Important to decide which OpenGL ES version to take.
- Shapes are defined using three-dimensional coordinates.
- Different shaders needed to draw a shape.
- Projection matrix is used to adjust graphics to the device screen.
- \blacksquare Camera transformation matrix is used to simulate a camera position.
- Rotation motion can be added using an additional matrix.
- \blacksquare Touch screen interaction can be implemented overriding $method\ \textit{on}\ \textit{TouchEvent}.$
